SUMMARY

.NET engineer with **5 years of commercial experience** at EPAM Systems, delivering enterprise systems across manufacturing ERP, B2B eCommerce and a public-sector platform that transfers legal vehicle ownership for the UAE government. I work a feature end to end — gathering requirements, designing the solution, writing the code, and covering it with tests I actually trust. Equally comfortable navigating a twenty-year-old legacy codebase and standing up a clean new service. Linux is my daily driver and I build my own tooling in Go and PowerShell.

TECHNICAL SKILLS

LANGUAGES	C#, T-SQL, PowerShell, JavaScript, TypeScript, Go (<i>side projects</i>)
BACKEND	.NET 6 / 8, ASP.NET Web API, ASP.NET MVC, Razor Pages, Mediator pattern, Microsoft Entra ID, OpenID Connect / OAuth 2.0, caching strategies
DATA	SQL Server, PostgreSQL, MongoDB, SQLite, Dapper, Entity Framework Core, FluentMigrator, stored procedures, query optimisation
TESTING	xUnit, NUnit, Moq, FluentAssertions, Selenium, integration & automation suites
FRONTEND	AngularJS, jQuery, Bootstrap, Gulp, Babel
PLATFORM & TOOLING	Docker, Azure Pipelines, Git, Tailscale, Linux (<i>daily driver, self-hosting, shell automation</i>), Mermaid

PROFESSIONAL EXPERIENCE

EPAM Systems — Software

Nov 2020 – Oct 2025

Engineer

Five years across three long-running client engagements, progressing from junior developer to owning features end to end and reviewing others' work.

Shary — UAE Government (TAMM portal)

Feb 2025 – Oct 2025

Stack: .NET 8, C#, ASP.NET Web API, Mediator, EF Core, stored procedures

- Designed and built the core functionality of a government service for **safe vehicle ownership transfer**, covering vehicles valued up to 50,000 AED.
- Owned features from requirement gathering with the BA and PM through technical design, implementation and verification.
- Delivered integrations with **ADCB bank** and the **TAMM** government platform, handling payment and identity flows.
- Held a verification-first standard where testing took roughly twice the development effort — the right trade-off for a system moving real money and legal title.
- Team of 9: 4 developers and 2 QA from EPAM, working alongside the client's developer, PM and BA.

Proactis / Hubwoo — B2B eCommerce Platform

Jul 2021 – Feb 2025

Stack: .NET 8, C#, ASP.NET Web API / MVC, Razor Pages, Dapper, Microsoft Entra, ABCpdf, xUnit, AngularJS

- Three and a half years of continuous ownership of a buyer–seller commerce platform, in a four-person EPAM team reporting directly to the client architect.
- Delivered full-stack features spanning the AngularJS / jQuery front end and the ASP.NET backend, from first ticket to production.

- Integrated **Microsoft Entra ID** for authentication, and implemented server-side PDF generation and caching to cut response times on heavy pages.
- Expanded the **automated test suite** — pages, actions and xUnit coverage — reducing the manual regression burden on every release.
- Acted as a regular code reviewer and drove sustained technical-debt reduction alongside feature work.

Plex Systems — Cloud Manufacturing ERP

Nov 2020 – Jun 2021

Stack: .NET, C#, ASP.NET MVC, WebForms, classic ASP (VB), stored procedures, JavaScript

- Contributed to **Plex Online**, a SaaS cloud ERP managing manufacturing operations — inventory, shipping, supply chain and quality.
- Delivered **application- and database-level optimisation** across a large legacy codebase spanning three generations of Microsoft web technology.
- Implemented new functionality and paid down technical debt in a 19-person cross-vendor team, gaining hands-on exposure to a wide range of e-business operations.

Career Break —

Oct 2025 – Oct 2026

conscription

Kept current through personal projects — Go, Linux self-hosting and .NET runtime internals.

Available immediately.

EDUCATION

Belarusian State University of Informatics and Radioelectronics

Sep 2017 – Jun 2021

Bachelor of Radio Engineering

PERSONAL PROJECTS

Bilingual Novel Reader — *C#/.NET, TypeScript*

A keyboard-driven web reader for serialised novels with word lookup built into the page. Layered .NET solution separating domain, persistence and dictionary concerns behind interfaces, with **MongoDB** for chapters and vocabulary, **SQLite** for accounts, cached chapter preparation, and a dictionary provider chain that falls back between Wiktionary and a free dictionary API. TypeScript front end.

TestChecker — *Go*

A terminal UI for learning by recall, built with Bubbletea. Answers are typed from memory in full and compared by **Levenshtein distance**, with spelling tolerance scaling to answer length. A companion daemon reconciles instances across machines over **Tailscale** — file watcher, per-topic locking, conflict resolution — tested on both layers. I use it daily to learn Polish.

MicrokernelPOC & PluginsWebApiWithAuth — *C#*

Paired experiments in runtime plugin architecture. The first swaps .NET implementations in a live process via **AssemblyLoadContext**, watched by interchangeable file-system and polling strategies; the second puts it to work in a Dockerised Web API behind an **OpenID Connect** identity provider. With AppDomain gone from .NET Core, real sandboxing needs process-level separation.

HelloGo — *Go*

A study repository for Go on Linux: an interpreter for a small language assembled from token, lexer, parser, AST and REPL layers with tests at each stage, alongside an HTTP service and a CLI to-do tool with interchangeable CSV and JSON persistence.

Animego Console — *PowerShell*

An HTML scraper and terminal client that streams a video site into VLC or ffplay. Grew from a search-and-watch script into a tool with downloading, model-based upscaling, favourites, watch history and resume.

AmendChangesGitHook — *Shell*

A post-commit hook that keeps history clean: any commit whose message is the single letter f automatically fixes itself up into the previous one.
